FLORIDA ESTIMATES OF POPULATION

April 1, 1987

prepared by the

POPULATION PROGRAM
BUREAU OF ECONOMIC AND BUSINESS RESEARCH
COLLEGE OF BUSINESS ADMINISTRATION
UNIVERSITY OF FLORIDA

FEBRUARY, 1988

These estimates were prepared under contractual agreement with the Florida Legislature, in accordance with Florida Statutes, Section 186.901. The Bureau of Economic and Business Research accepts full responsibility for the contents of this publication.

This public document was promulgated at an annual cost of $323.07 or $.16 per copy to make available intercensal population estimates for Florida. The sale price of this publication is set to cover the total cost of producing it. The "annual cost" to the Bureau shown in this box is only that part of the cost paid out of state funds.

Florida Estimates of Population 1987

Analysis of Current Trends

Florida is one of the most rapidly growing states in the nation. While the U.S. population grew by 11.4 percent between 1970 and 1980, Florida's population grew by 43.5 percent. Only Nevada (63.1 percent) and Arizona (53.1 percent) grew more rapidly. Florida's net increase of 2.95 million was also third largest in the nation, trailing only California's 3.70 million and Texas's 3.03 million. Each of Florida's sixty-seven counties gained population during the 1970s. Some, of course, grew more rapidly than others. Citrus, Hernando and Pasco counties each grew by more than 150 percent between 1970 and 1980, while Gulf, Gadsden, Duval and Franklin counties each grew by less than 10 percent. Broward, Dade, Palm Beach and Pinellas counties each increased by more than 200,000 residents between 1970 and 1980, while Gulf, Franklin, Liberty and Hamilton counties each increased by less than 1,000.

Florida's rapid growth has continued since 1980. The state's population grew by almost 2.3 million between 1980 and 1987, more than all states except California and Texas. Florida's growth rate from 1980 to 1987 was 23.6 percent, higher than all states except Alaska, Arizona and Nevada. The counties with the largest numerical increases were Palm Beach (212,775), Dade (176,918), Broward (162,728), Hillsborough (154,453), Orange (132,474) and Pinellas (100,169). The counties with the largest percentage increases were Hernando (79.1 percent), Osceola (77.6 percent), Flagler (76.3 percent), Charlotte (50.9 percent) and Citrus (49.6 percent). Every one of Florida's sixty-seven counties gained population between 1980 and 1987.

Guidelines for Population Estimation

The population estimates for the State of Florida, its counties, municipalities and unincorporated areas have been prepared under a contractual agreement between the Florida Legislature and the Bureau of Economic and Business Research (BEBR), University of Florida. These estimates for April 1, 1987, will be used for state revenue-sharing distributions in the fiscal year 1988-89. The basic guidelines for the generation of the population estimates were established by the 1972 Florida Legislature in Chapter 23, Section 23.019, Florida Statutes, entitled, "Population census determination." These guidelines have been revised several times since 1972, the most recent being Section 186.901 of the 1985 Florida Statutes, which states:

(1) The Executive Office of the Governor, either through its own resources or by contract, shall produce population estimates of local governmental units as of April 1 of each year, utilizing accepted statistical practices. The population of local governments, as determined by the Executive Office of the Governor, shall apply to any revenue-sharing formula with the local governments under the provisons of ss. 218.20-218.26, part II of chapter 218. For municipal annexations or consolidations occurring during the period April 1 through February 28, the Executive Office of the Governor shall determine the population count of the annexed areas as of April 1 and include such in its certification to the Department of Revenue for the annual revenue-sharing calculation.

(2) (a) Population shall be computed as the number of residents, employing the same general guidelines used by the United States Bureau of the Census.

(b) For the purpose of revenue sharing distribution formulas and distribution proportions for the local government half-cent sales tax, inmates and patients residing in institutions operated by the Federal Government, the Department of Corrections or the Department of Health and Rehabilitative Services shall not be considered to be residents of the governmental unit in which the institutions are located.

(c) Nothing herein shall be construed to prohibit the separate determination of any categories of persons, whether resident or nonresident.

(3) In cases of annexation or consolidation, local governments shall be required to submit to the Executive Office of the Governor, within 30 days following annexation or consolidation, a statement as to the population census effect of the action.

(4) Estimates of inmates and patients pursuant to paragraph (2)(b) shall be separately stated in population reports issued pursuant to this section.

It should be noted that the population estimates published herein refer only to permanent residents of the State of Florida. According to Census Bureau guidelines, one's permanent residence is one's usual residence, or the place one lives and sleeps most of the time. Thus temporary residents such as tourists and snowbirds are not included in these estimates. Many places in Florida have large numbers of temporary residents during certain times of the year, making their total de facto populations much larger than their permanent populations.

Estimation Methodology

The technique used by the BEBR to produce population estimates is a housing-unit method in which changes in population are assumed to be reflected by changes in occupied housing units. While this method is subject to certain problems, it is one of the few techniques suitable for making small-area population estimates. A recent survey conducted by the Census Bureau showed that of 410 agencies making substate population estimates in 1975, 314 (or 77 percent) used some form of the housing-unit method.

Three components are required for a housing-unit estimate of permanent resident population: the number of permanently occupied housing units (households); the average number of persons occupying these housing units; and the number of persons living in group quarters such as college dormitories, military barracks, nursing homes and penal institutions. The final population estimate for a local area is equal to the product of the permanently occupied housing units times the average number of persons per household, plus the number of persons living in group quarters.

Occupied housing units

Two data series are used to estimate occupied housing units: residential building permits and active residential electric customers. The housing inventory for a city or county which issues building permits can be estimated by adding permits issued since 1980 to the units enumerated in the 1980 census. These data are collected from each permit-issuing agency in the state through a cooperative program of the BEBR and the United States Department of Commerce. The time lag between issuance of a permit and occupancy of the completed structure is assumed to be four months for single-family units and ten months for multifamily units; no lag is assumed for mobile home units or demolitions. Construction of an inventory for a county requires complete permit data for every area in the county. While such data are not always available, coverage is sufficient in most Florida counties to provide useful information.

Determination of current, accurate, census-definition occupancy rates is extremely difficult. Census definitions require a person to be "...counted as an inhabitant of his usual place of residence, which is generally construed to mean where he lives and sleeps most of the time. This residence is not necessarily the same as his legal residence, voting residence, or domicile." Under this definition, a unit is vacant even though it is continuously occupied, if the occupants are different persons, each of whom stays for only a short time. The only effective methods of determining current occupancy rates are special censuses or sample surveys, which are usually too expensive to be feasible. A common solution is the use of 1980 census occupancy rates even though they may have changed. This is the procedure adopted by the BEBR.

The product of the inventory figure and the occupancy rate (preferably performed separately for each unit type and summed) provides an estimate of permanently occupied housing units. Unfortunately there are several problems with this estimate. Time lags between issuance of permits and completion of units may vary from place to place and from year to year. The proportion of permits resulting in completed units is usually unknown. Current occupancy rates are unavailable. These problems limit the usefulness of building permits as an estimator of occupied housing units. Certificate-of-occupancy data or housing counts eliminate problems relating to completion rates and time lags but not those relating to occupancy rates or accurate estimates of demolitions and conversions.

We have found that permanent resident households can be estimated more accurately from our second data source, active residential electric customers. Current households are generally estimated by multiplying the 1980 ratio of households to active residential electric customers times the number of current active residential customers. This procedure assumes that no changes have occurred in either utility bookkeeping practices or the proportion of customers who are permanent residents. While exceptions have occurred, experience has shown that these requirements are fulfilled for most areas in Florida. In a few places we adjust the household/electric customer ratio to account for changes in the proportion of total housing units occupied by permanent residents. Our research has indicated that estimates of current households based on electric customers are usually superior to those based on building pennits.

Ideally, both good permit data and good customer data are available. Electric customer data provide good estimates of total households but do not provide information about changes in the mix of housing types (single-family, multifamily, mobile home). Permit data provide less reliable estimates of total households than electric customer data, but provide information about changes in the mix of housing types. When good permit data can be combined with good electric customer data, it is possible to produce population estimates superior to those based on either series alone.

Average household size

The second component of the housing-unit method is average household size, or the average number of permanent residents per permanently occupied housing unit. Average household size can change substantially over time. Table A shows that average household size for the United States declined by 12.1 percent between 1970 and 1980. This decline was caused primarily by declining birth rates, increasing divorce rates, the tendency for more older persons to maintain their own homes after their families have disbanded and the large number of young adults forming one- and two-person households. In Florida an additional factor contributing to this decline was the high rate of inmigration of older persons.

Table A.--Average Household Size for the United States, 1940-1987

Year	Average household size	Year	Average household size
1940	3.67	1970	3.14
1950	3.37	1980	2.76
1960	3.33	1987	2.66

Source: U.S. Bureau of the Census, *Current Population Reports*, Series P-20, No. 417, August, 1987.

Average household size has continued to decline since 1980, although at a slower pace than between 1970 and 1980. Nationally, average household size declined 3.6 percent between 1980 and 1987. We believe similar declines have occurred in Florida. For each city and county in Florida, the estimates of average household size in 1987 were based on the average household size calculated from the 1980 census, the decline in average household size for the United States between 1980 and 1987, and the local change in the mix of single-family, multifamily and mobile home units occurring between 1980 and 1987. A more detailed description of the exact techniques used to estimate average household size can be found in "Some New Techniques for Applying the Housing Unit Method of Local Population Estimation," *Demography*, Vol. 17, No. 3, August, 1980, pages 323-339. Copies of this paper can be ordered from the Bureau of Economic and Business Research.

Group quarters population

Population in housing is estimated as the product of average household size and occupied housing units. To obtain an estimate of total population, group quarters population must be added. In most instances we estimate group quarters population by assuming it equals the same proportion of population in housing in 1987 as it did in 1980. For example, if group quarters population equaled 1.5 percent of population in housing in 1980, we would estimate current group quarters population as 1.5 percent of the current estimate of population in housing. In places where group quarters population represents a substantial proportion of total population (college dormitories, penal institutions, military bases or long-term health care facilities), actual population counts are obtained from the administrators of each facility. The total population estimate is then made by adding the group quarters population to the estimate of population in housing. Inmates in state and federal institutions are counted separately in all local areas; these numbers are available from the federal government, the Department of Corrections and the Department of Health and Rehabilitative Services.

Conclusion

The population estimates produced by the BEBR are calculated by multiplying the estimated number of permanent resident households by the estimated average household size and adding the estimated number of permanent residents living in group quarters. This methodology is conceptually simple but effective. It utilizes data that are available for all local areas, its components respond very rapidly to population movements, and it can be applied systematically and uniformly everywhere in the state. A comparison of the estimates produced by the BEBR with 1980 census results showed the BEBR estimates to be quite accurate. (An evaluation of the accuracy of the BEBR estimates can be found in *The Journal of the American Statistical Association*, Vol. 79, No. 386, June 1984, pages 282-289.) Our fifteen years of experience have convinced us that despite its shortcomings, this is the most effective method for making city and county population estimates in Florida.

Note

The 1980 census counts reported in this booklet include all adjustments through October 31, 1987, made to the numbers originally published by the U.S. Bureau of the Census. As a result of these adjustments, the 1980 census numbers for some cities and counties published herein will differ from those published previously by the Bureau of Economic and Business Research.

Explanation of Terms

April 1, 1980 (Census)

The permanent resident population enumerated in the 1980 Census. The numbers shown in this publication may differ from those in earlier publications because they include all revisions made to the original counts through October 31, 1987.

Total change

The total change between the April 1, 1980, U.S. Census figure and the estimate for April 1, 1987, including change due to natural increase (or decrease) and net migration. This figure also includes any population change due to annexation.

April 1, 1987 (Est.)

The estimated permanent resident population for April 1, 1987. This figure is comparable to the Census enumeration and should be used for most purposes of planning and analysis.

Inmates

The inmates and patients in institutions operated by the federal government, the Department of Corrections and the Department of Health and Rehabilitative Services as of April 1, 1987, to be excluded as residents for revenue sharing distribution as required by state law.

Estimate less inmates April 1, 1987

The population estimate minus inmates to be used for state revenue sharing in the 1988-89 fiscal year. This figure should not be used for other purposes.
